

Test Instrumentation Range Overview

Comparison Noise Emitters
(CNEs) Broadband Noise Signal Source

Comb Generator Emitters
(CGEs) Reference Signal Source

York Reference Sources
(YRSs) Dual Comb and Broadband Noise Emitters

Antennas, Harmonics & Flicker
Active Receive Antenna, Cable Coupling
Clamps, Accessories

Eurofins York's Test Instrumentation Range

Eurofins York (formerly York EMC Services), based in York, UK, are an established leader in the design and manufacture of reference signal sources and accessories for Electromagnetic Compatibility (EMC) and other Radio Frequency (RF) related applications.

Eurofins York Test Instrumentation have frequency outputs of up to 40 GHz which are highly stable over time. They provide the user with a reliable, known reference output to characterise the performance of systems including: EMC test

and measurement systems, measurement environments, screened rooms, anechoic chambers, open area test sites (OATS), filters, cables, connectors, amplifiers, receivers and spectrum analysers, measuring the shielding effectiveness of enclosures and materials.

The availability of both conducting and radiating output from our Test Instrumentation range further enhances this broad range of uses.

All of our products are available worldwide.

For more detailed information, to find your local Eurofins York Distributor, or to download our full Test Instrumentation Range Brochure, please visit www.yorkemc.com

Reference Noise and Signal Sources

Comparison Noise Emitters

The Comparison Noise Emitter (CNE) series generate stable **continuous** broadband outputs from **30 Hz up to 6 GHz**. With an unrivalled reputation for stable output over both time and temperature, the CNEs are available in three models:

- CNE V – 9 kHz to 1 GHz output
- CNE V+ – 9 kHz to 3.5 GHz output (useable output to 5 GHz)
- CNE VI – 30 Hz to 6 GHz output

When used as a verification reference source, the known output allows unknowns within systems or components to be measured or calculated. Being a continuous emitter across their operating frequency range, they allow for a complete evaluation of the equipment being analysed without any gaps in the spectrum.

Comb Generator Emitters

Our harmonic **Comb** Generator Emitter (CGE) series generate stable broadband outputs from **50 MHz up to 40 GHz**. They are available in three models with both radiated (R) and/or conducted (C) versions available:

- CGE 01 – 50 MHz to 18 GHz output
- CGE 02 – 250 MHz to 26 GHz output
- CGE 03 – 900 MHz to 40 GHz output

When used as a verification reference source, the known output allows unknowns within systems or components to be measured or calculated.

The CGE reference signal sources are physically small and battery powered, allowing them to be used in a wide range of situations without requiring external power sources or cabling.

Reference Signal Source Frequency Coverage

■ Noise Reference
■ Comb Reference

Harmonics and Flicker Test Signal Sources

The Harmonics & Flicker Generators (HFG01 and HFG02) have been designed for the purpose of verifying harmonic and flicker test equipment by simulating the equipment under test (EUT). They provide an easy and reliable way to externally check the performance of measurement systems used to test the EN / IEC 61000-3-2 harmonics and EN / IEC 61000-3-3 flicker standards.

Compact Emissions Measurement Antenna

The Active Receive Antenna (ARA 01) is a highly compact emissions receive antenna with an antenna factor comparable to a conventional wideband antenna such as the Bilog™ and other commercially available wideband antennas operating between **30 MHz and 1 GHz**. The ARA01's small size makes it particularly suitable for use in anechoic chambers; however it can also be used on an Open Area Test Site (OATS) or at on-site locations. The ARA 01 features two sets of interchangeable Dipole Antenna Elements (DAE). The standard set (DAE01) is optimized for 200 MHz to 1 GHz, with usable sensitivity down to 30 MHz. For improved sensitivity between 30 MHz to 300 MHz, the optional DAE02 set is available.

Cable Shielding Measurement Clamp

The Cable Coupling Clamp (CCC01) is a reusable test jig for the purpose of measuring the shielding properties of cables via their transfer impedance characteristics. The CCC01 is designed to allow easy positioning of the test and injection feed cables in accordance with the layout described in IEC 96-1 Amendment 2 1993-06. This simplifies the process of making repeatable measurements aimed at assessing the coupling and shielding effectiveness properties of a wide range of cables.

Instrumentation, Consultancy and Research, Training

York Reference Sources

This unique series of instruments, the York Reference Sources (YRSs) have dual capability, as each model is able to generate both **continuous noise and comb** signal outputs. Covering a signal frequency band from **5 kHz up to 6 GHz**, there are three models* available:

- YRS 01 – 9 kHz to 1 GHz Continuous Noise output and 5 kHz to 1 GHz Comb output; all in a compact round housing compatible with a CGE battery pack
- YRS 02 – 9 kHz to 1 GHz Continuous Noise output and 5kHz and 1 GHz Comb output in a compact housing powered by 4 x AA batteries
- YRS 03 – 10 MHz to 6 GHz Continuous Noise and Comb output in a compact housing powered by 4 x AA batteries

The noise generator enables observation of details over the full spectral range, while the comb generator allows for both reference signal output and noise floor to be viewed simultaneously, and the frequency accuracy of the measurement equipment to be checked.

*The YRS combination kit is also available containing the YRS02 and YRS03, giving the full output range without duplication of accessories; see full brochure for details.

Calibration Service

We offer an optional Manufacturer's Calibration service whose fast turnaround minimises your downtime.
